

ABSTRACT

A universal bracket system includes a bracket (200) having a proximal end (210) with an upper portion (212) formed with an upwardly projecting recess (214). A downwardly projecting slot (220) is formed at a lower portion of the upper projection (216). When the bracket (200) is in a final coupling position relative to a supporting rack (130), the 5 downwardly projecting slot (220) captures an intermediate portion (136) of the rack (130) located between a pair of rack slots (132, 134).
